STATISTICAL ANALYSIS AND PROBABILITY									
Standard Error		Mean							
$SE_{\bar{x}} = \frac{s}{\sqrt{n}}$		$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i$							
Standard Deviation		Chi-Square							
$s = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n-1}}$		$\chi^2 = \sum \frac{(o-e)^2}{e}$

Mode = value that occurs most frequently in a data set									
Median = middle value that separates the greater and lesser halves of a data set									
Mean = sum of all data points divided by number of data points									
Range = value obtained by subtracting the smallest observation (sample minimum) from the greatest (sample maximum)									

s = sample standard deviation (i.e., the sample based estimate of the standard deviation of the population)
 \bar{x} = mean
 n = size of the sample
 o = observed individuals with observed genotype
 e = expected individuals with observed genotype

Degrees of freedom equals the number of distinct possible outcomes minus one.
